

Week 10:

Given a string, *s*, consisting of alphabets and digits, find the frequency of each digit in the given string.

Input Format

The first line contains a string, *num* which is the given number.

Constraints

$$1 \leq \text{len}(\text{num}) \leq 1000$$

All the elements of *num* are made of English alphabets and digits.

Output Format

Print ten space-separated integers in a single line denoting the frequency of each digit from **0** to **9**.

Sample Input 0

a11472o5t6

Sample Output 0

0 2 1 0 1 1 1 1 0 0

Explanation 0

In the given string:

- **1** occurs two times.
- **2, 4, 5, 6** and **7** occur one time each.

The remaining digits **0, 3, 8** and **9** don't occur at all.

REC-CIS

Answer: (penalty regime: 0 %)

```
#include<stdio.h>
#include<string.h>
#include<ctype.h>
int main()
{
    char s[1000];
    int arr[]={0,0,0,0,0,0,0,0,0,0};
    scanf("%s",s);

    for(int i=0;i<strlen(s);i++)
    {
        if(isdigit(s[i]))
        {
            arr[s[i]-'0']+=1;
        }
    }

    for(int i=0;i<10;i++)
```

REC-CIS

Answer: (penalty regime: 0 %)

```
char s[1000];
int arr[]={0,0,0,0,0,0,0,0,0,0};
scanf("%s",s);

for(int i=0;i<strlen(s);i++)
{
    if(isdigit(s[i]))
    {
        arr[s[i]-'0']+=1;
    }
}

for(int i=0;i<10;i++)
printf("%d ",arr[i]);

return 0;
```

Today, Monk went for a walk in a garden. There are many trees in the garden and each tree has an

English alphabet on it. While Monk was walking, he noticed that all trees with vowels on it are not in good state. He decided to take care of them. So, he asked you to tell him the count of such trees in the garden.

Note: The following letters are vowels: 'A', 'E', 'I', 'O', 'U', 'a', 'e', 'i', 'o' and 'u'.

Input:

The first line consists of an integer T denoting the number of test cases.

Each test case consists of only one string, each character of string denoting the alphabet (may be lowercase or uppercase) on a tree in the garden.

Output:

For each test case, print the count in a new line.

Constraints:

$$1 \leq T \leq 10$$

$$1 \leq \text{length of string} \leq 10^5$$

Given a sentence, s , print each word of the sentence in a new line.

Input Format

The first and only line contains a sentence, s .

Constraints

$$1 \leq \text{len}(s) \leq 1000$$

Output Format

Print each word of the sentence in a new line.

Sample Input 0

This is C

Sample Output 0

This

is

C

Explanation 0

In the given string, there are three words ["This", "is", "C"]. We have to print each of these words in a new line.

The screenshot shows a web browser window with a URL that includes 'Coding-Attempt-Session'. The page displays a C program solution for splitting a string into words. The code is as follows:

```
Answer: (penalty regime: 0 %)  
  
#include<stdio.h>  
#include<string.h>  
int main()  
{  
    char s[1000];  
    fgets(s,1000,stdin);  
    for(int i=0;i<strlen(s);i++)  
        printf("%s",s[i]!=' ')?s[i]:'\n');  
    return 0;  
}
```

The browser's address bar shows the URL: <https://www.coding-Attempt-Session.org/contest/contest/contest.php>. The browser's status bar at the bottom shows the time as 17:25 on 10-01-2023.

	Input	Expected	Got

Input Format

You are given two strings, ***a*** and ***b***, separated by a new line. Each string will consist of lower case Latin characters ('a'-'z').

Output Format

In the first line print two space-separated integers, representing the length of ***a*** and ***b*** respectively.

In the second line print the string produced by concatenating ***a*** and ***b*** (***a + b***).

In the third line print two strings separated by a space, ***a'*** and ***b'***. ***a'*** and ***b'*** are the same as ***a*** and ***b***, respectively, except that their first characters are swapped.

Sample Input

abcd

ef

Sample Output

4 2

abcdef

ebcd af

Explanation

a = "abcd"

b = "ef"

|a| = 4

|b| = 2

a + b = "abcdef"

a' = "ebcd"

b' = "af"

The screenshot shows a C++ program in a code editor and its execution results in a terminal window. The program reads two strings, a and b, and prints their lengths, the concatenated string, and the strings after swapping the first characters.

```
Answers: (penalty regime: 0 %)  
#include<stdio.h>  
#include<string.h>  
int main()  
{  
    int n,m;  
    scanf ("%d%d",&n,&m);  
    char a[n],b[m],s[n],temp;  
    scanf ("%s %s",a,b);  
    strcpy(s,a);  
    printf ("%d %d\n",strlen(a),strlen(b));  
    printf ("%s\n",strcat(s,b));  
    temp=a[0];  
    a[0]=b[0];  
    b[0]=temp;  
    printf ("%s %s",a,b);  
    return 0;  
}
```
